

Use-Case Flow Specification

Use Case: Book Video Consultation Slot

Primary Actor	Patient
Secondary Actor	Payment Gateway (external system)
Preconditions	Patient is authenticated and logged in. The chosen physician has published open (unbooked) consultation slots.
Postconditions	The slot is marked "Reserved" for the patient, a booking record exists, payment has been captured, and both patient and physician have received a confirmation notification.

Main Success Scenario

1. Patient logs into the portal and selects “Book Consultation.” The system displays available specialties.
2. Patient selects a specialty. The system displays physicians in that specialty along with their open slots.
3. Patient selects a physician and a specific time slot. The system displays slot details and the consultation fee.
4. Patient confirms the selection. The system places a temporary 10-minute hold on the slot.
5. The system requests a payment method (credit card / debit card / UPI / wallet).
6. Patient selects a payment method and confirms payment.
7. The system sends the transaction request to the Payment Gateway.
8. The Payment Gateway authorizes the payment.
9. The system confirms the booking, updates the slot status to “Reserved,” and creates a booking record.
10. The system sends a confirmation notification with consultation details to both patient and physician. Use case ends successfully.

Alternate Flow — 8a. Payment Declined

1. The system displays a “payment failed” message and keeps the temporary hold active.
2. Patient is prompted to try another payment method.
3. If payment fails again (after 2 attempts), the temporary hold is released, the booking is cancelled, and the patient is notified to retry later.
